

Business Intelligence & Analysis

Managing a business intelligence (BI) project is very different from managing a traditional software development project, due to the melding of wide-ranging business requirements with various software and hardware technologies. In addition to this, traditional software development projects adhere to a development methodology that logically progresses in a serial manner until completion, while BI projects require an iterative approach that begins in development and continues through implementation as new information requirements are addressed and the business evolves.

Our approach is practical, efficient and results-oriented:

- > Analyze requirements with continuous focus on business needs.
- > Select Business Intelligence technology best suited to business needs and technical requirements.
- > Manage projects efficiently, and anticipate rather than react.
- > Determine business process improvements yielding the highest impact.
- > Design and deploy customized, automated applications that fully leverage data.
- > Engage in thorough testing (including data validation and user acceptance).
- > Train solution end users to begin deriving value immediately.
- > Train in-house administrators to maintain and update the application.
